

THE SCENARIO

Sequencing Growth – Phases 1 & 2

SET THE SCENE

It's 2027. The Southeast Secondary Plan is adopted. Phase 1 servicing is funded. The land-use plan already decides what goes where – mixed-use node in Phase 2, residential plus other uses in Phase 1.

Your table decides **how Phases 1 and 2 actually build out** at a scale that adds up to a complete community.

WHAT TO SKETCH ON THE MARKUP MAP

1. **Building footprints** – rough scale, where they cluster, how they front the street.
2. **Accesses** – primary routes in, where active modes connect, where parking lives.
3. **The mix** – mark where each land-use type lands in Phase 1 and at the Phase 2 Central Node, and roughly at what intensity.
4. **One sentence** on what triggers Phase 2 – population, servicing, frontage demand, something else.

PROMPTS TO ANCHOR THE CONVERSATION

You don't have to answer all of them. **They're scaffolding** – if your table is circling, pick the prompt that gets it unstuck and start there.

- 1** **PHASE 1, DAY ONE**
Stand at the edge of Phase 1 on move-in morning. What does a resident need within a five-minute walk for this to feel like a neighbourhood and not a subdivision?

 - 2** **SCALE THAT PENCILS**
The Central Node is in Phase 2. What's the smallest viable version of it that can open without sitting empty waiting for residential to catch up?

 - 3** **MIX WITHOUT SPRAWL**
Phase 1 is residential plus "some other uses." What other uses, where, and at what frontage – without diluting the Central Node before it opens?

 - 4** **WALKABLE FROM ISOLATION**
The site has no neighbouring village. Which streets, frontages, or block sizes in Phases 1 and 2 do the most work to discourage car-only living before the rest of the node arrives?

 - 5** **THE TRIGGER**
What has to be true on the ground for it to be the right moment to move from Phase 1 into Phase 2? Population? Absorption? Servicing milestone? Something else?
